                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       biomass, enhanced survival capacity, stress tolerance, plant architecture or physiology, altered endoreduplication, biochemistry, signal transduction, storage lipid mobilisation and/or altered photosynthesis, each relative to the corresponding wild type plants. Accordingly, these sequences can also be useful as positive or negative selectable markers during transformation of cells or tissues. The identified genes play a role in a variety of biological processes such as DNA replication, cell wall biosynthesis, nitrogen and/or carbon metabolism or they function as transcription factors. This polypeptide sequence is thale cress protein expressed by a gene repressed 1.3 fold or more in plants overexpressing the E2Fa/DPa transcription factor, given in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                characteristics. Specifically, it refers to identifying genes that are up or down-regulated in transgenic plants overexpressing the heterodimeric EZFA/DPA transcription factor of Arabidopsis and using these sequences to alter plant characteristics accordingly. The present invention describes generating transgenic plants for the production of growth regulators, enzymes, therappeutics, pharmaceuticals and animal feed products, where the altered plant characteristics are selected from increased yield or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Altering plant characteristics, useful for producing plants for enzyme pharmaceutical production comprises modifying in a plant, expression of one or more nucleic acids and/or modifying level or activity of one or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Altering plant pharmaceutical

                                                                                                                                                                                                                       Many plant secondary metabolites have value as pharmaceuticals, food colourings, flavours and fragrances. Some plant secondary metabolites are clinked to plant or plant cell defence mechanisms and may confer to the plant antimicrobial activity, protection against UN light, herbivores, compatible indole alkaloids (TIA) represent a class of pharmaceutically cuseful compounds which maturally occur in many plant species. New methods are described which medulate the expression of one or more genes involved in the biosynthesis of plant metabolites or their precursors in plant cells. The method comprises inserting into a plant cell a sequence encoding a transcription factor comprising an AP2 DNA-binding domain and comprising an AP2 DNA-binding domain are useful as central cregulators of complex metabolite pathways involving numerous target genes for such transcription factors. This means that the yield of commercially containable metabolite compounds can be enhanced and the tolerance of plants commarcially the level of one or more metabolite is enhanced towards exogenous stress factors can be influenced. The method is useful compounds exogenous stress factors can be influenced. The method is useful towards exogenous stress factors can be influenced. The method is useful to which the transcription factor to the cell the level of the metabolite is enhanced by at least 10%, 25% or 100% or reduced 10%, 25%, 50% or 90% relative to

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
